

Dear Grimlore Games Team,

I am writing to apply for a mandatory internship in game development/game design at Grimlore Games. I am currently approaching the end of my fourth semester in Computer Science and Design at Munich University of Applied Sciences. As part of my degree, I am required to complete a mandatory internship next semester, and I would be very interested in completing it within your development team.

Through my studies and personal projects, I have gained foundational experience in game development and the creation of interactive applications. I have programming knowledge in Python and C# and have worked on gameplay-related systems, prototypes and smaller game projects. These experiences have strengthened my understanding of object-oriented programming, software architecture and the process of developing an initial concept into a functional interactive experience.

One project that particularly developed my technical skills was a particle simulation created as part of my studies. The project involved implementing and controlling the behaviour of many individual particles while considering performance, system structure and visual presentation. It gave me valuable experience in building dynamic systems in which multiple components interact to produce more complex behaviour.

My degree combines computer science with design, allowing me to approach projects from both a technical and creative perspective. I am interested not only in how a game functions internally, but also in how gameplay mechanics, visual feedback and user interaction contribute to the overall player experience. I believe this interdisciplinary background would allow me to contribute effectively to a development team while continuing to expand my practical skills.

Grimlore Games is especially interesting to me because of your work on *Titan Quest II*. The original *Titan Quest* was one of my favourite games during my childhood, so the opportunity to learn from the studio developing its sequel would be particularly meaningful to me. At the same time, I am eager to gain insight into professional game production and contribute wherever my technical and creative abilities can support the team.

I am a motivated and curious learner who enjoys solving both technical and creative problems. I would be very pleased to discuss the possibility of completing my mandatory internship at Grimlore Games and contributing to your team next semester.

Thank you for considering my application. I look forward to hearing from you.

Kind regards,
Sebastian Hilger
